Touching lives through innovation

Operation Phakisa: Aquaculture

- Relatively young industry with potential for growth
- Together, the Aquaculture and Fisheries sector could contribute approximately R10-15 Billion to SA's GDP

Marine Aquaculture in South Africa

- Marine Aquaculture in South Africa includes:
 - Abalone
 - Mussels
 - Oysters
 - Finfish
- Depending on the cultured organisms these could include
 - In-water cages or rafts
 - Land-based pump-ashore operations
- Each operation method has different environmental risk

Environmental risk: Harmful Algal Blooms (HABs)

- Phytoplankton or Algae are microscopic plant-like organisms
- They can discolour the water if they occur in “blooms” or high concentrations
- Some can be harmful to the aquaculture industry through:
 - Toxicity
 - Mechanical damage
 - Hypoxia

Gonyaulax spinifera

Economic risks to aquaculture and fisheries

RED TIDE DEVASTATES SOUTH AFRICAN ABALONE FARMS

Dr. Anna Mouton, BVSc, MSc

South African abalone farms suffered devastating losses from a harmful algal bloom earlier this year. Three farms on the South coast, lost up to 50 percent of their stock. One farm held an estimated 24 million abalone, or a third of the country's total. African farm

Red Tide outbreak on Garden Route

WESTERN CAPE / 15 December 2015, 8:22pm

Jabulile S. Ngwenya

Cape Town - An outbreak of Harmful Algal Bloom (HAB), also known as Red Tide, has been confirmed along the Garden Route coastal area, the Department of Environmental Affairs (DEA) announced on Tuesday.

Harmful Algae Kills 200 Tons of Rock Lobsters Off South Africa

Wednesday, 11 February 2015 Written by Bloomberg

Operation Phakisa - Initiative 6

The National OCIMS

- Develop a locally relevant and globally cognisant **technological solution** that supports the economic potential of South Africa's Oceans through information for **effective governance**.

Vision

- Integrate current and future systems, information and expertise into a user-friendly and cost effective national Oceans and Coasts information system for the **benefit** of relevant **stakeholders**

Mission

- Decision making support
- Strategic and operational **planning**
- **Protection** oceans and coastal environment
- Economic growth and **job creation**

Benefit

OCIMS Decision Support Tools (DeST)

Coastal Viewer

Fisheries & Aquaculture Support

Marine Spatial Planning

Coastal Flood Hazard

Marine Predators

Coastal Operations at Sea

Integrated Vessel Tracking

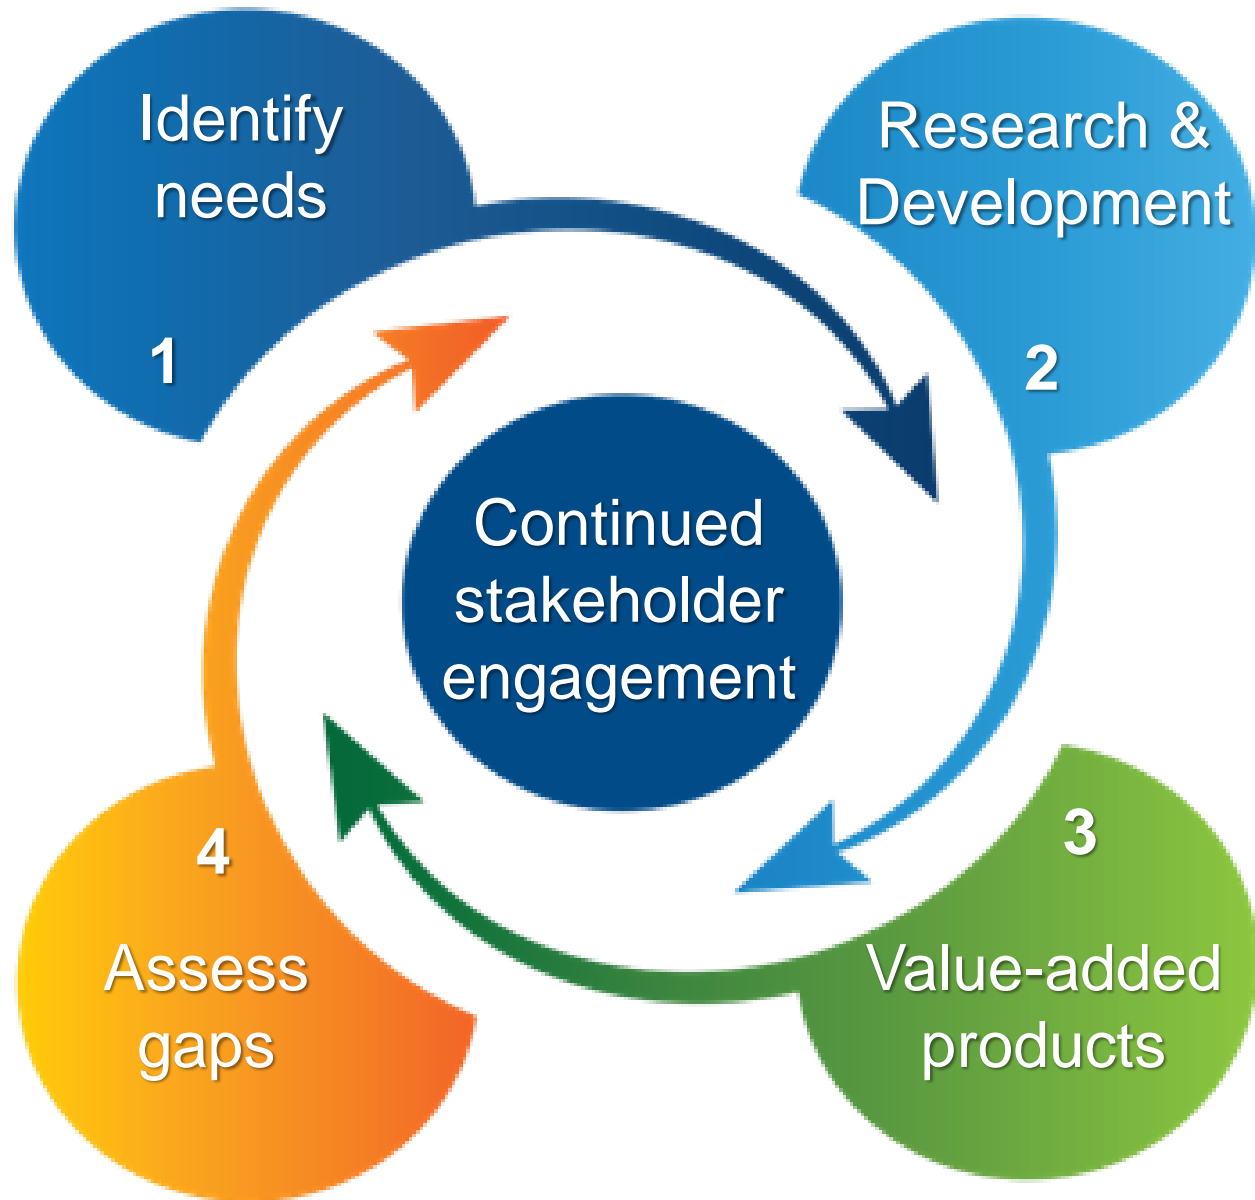

Marine Information Management System (MIMS)

- Multiple tools servicing different sectors across the marine domain
- Decision Support Tools developed through consultations between developers and stakeholders

OCIMS DeST development cycle

- Champion users, stakeholders and developers make up Technical Advisory Groups (TAGs) which meet regularly
- Simple, powerful value-added products shared for user input

Identify Needs: Users and stakeholders of the Aquaculture DeST

Please indicate your interest in this decision support tool:

28 responses

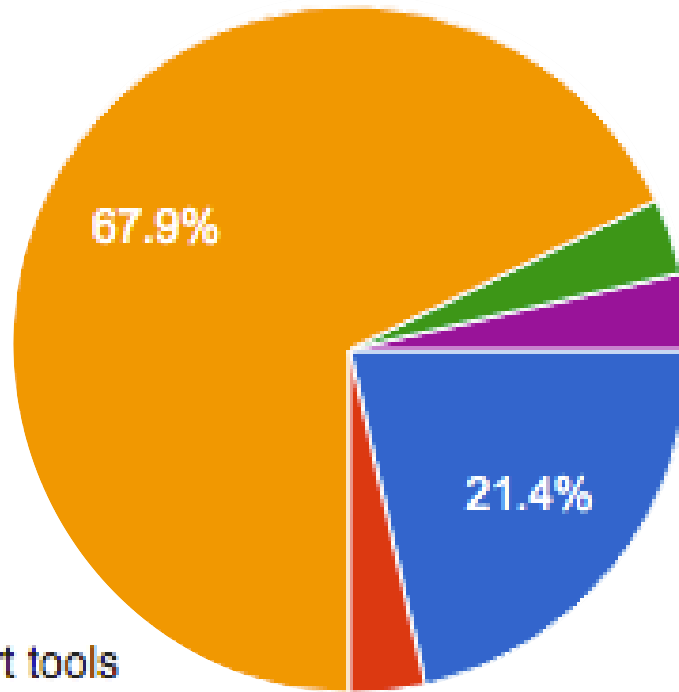

Users include:

- Aquaculture farm managers
- Government (e.g. DFFE)
- Municipal managers
- Disaster management
- Fisheries managers
- Regulators

Identify Needs: Harmful Algal Bloom Detection requirements

Is your interest in this decision support tool based on obtaining:

- Near real time information
- Historical analysis of products
- Both
- General marine decision support tools
- Food security enhancement

Useful information for management include:

- Bloom proximity
- **Phytoplankton type ~ risk**
- Bloom spatial extent
- Persistence ~ anoxia
- Trajectory

provided in near-real time and historically

Research & Development: Marine Earth Observation

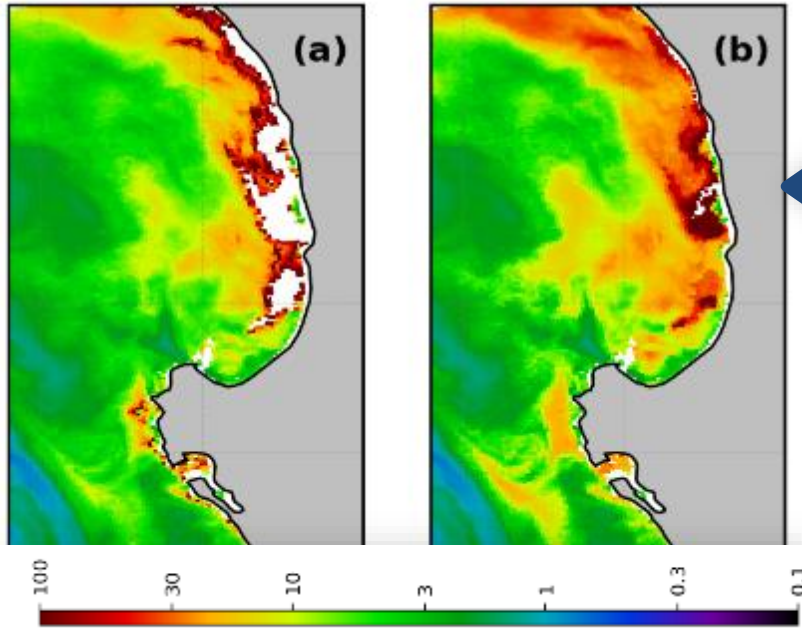

- Satellite provides information over much greater space and time scales than possible with only in-water measurements
- Our research has focused on:
 - Understanding the **regional oceanography** and how it affects HAB formation
 - Assessing the best **sensors** and **detection techniques** for HABs
 - Creating **regional algorithms** to improve satellite-derived products

fish and shellfish washouts and mortalities on the west coast of South Africa
25 March 2021

Over the past week large fish and shellfish aggregations, in the shallow nearshore, as well as mortalities and washouts, have been observed in three different parts of the coast from Elands Bay to north of the Olifants River Estuary, in the Port of Cape Town and in False Bay. The stressed and stranded animals include sardine, hangers, white slumprose, cuttlefish and octopus. Surprisingly, no lobster (keef) walkouts or kills have been reported whereas in False Bay, mostly pufferfish (blaasops) have washed up on the shore.

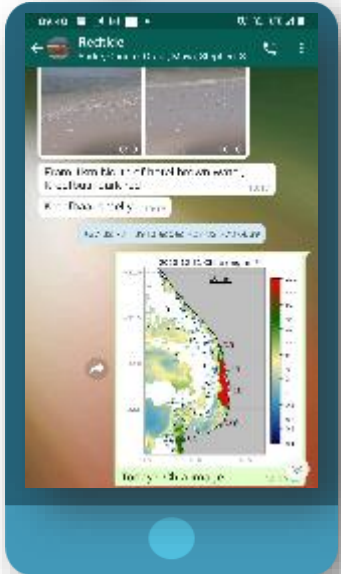

The phytoplankton identified at Elands Bay is not toxic and therefore unlikely responsible for the fish and shellfish mortalities there. The washouts and mortalities are more likely a result of the current icy and anoxic (zero oxygen) deep water conditions there which are probably driving fish and shellfish into the warmer, shallow and more oxygen rich nearshore. Some of these stressed fish become too weak to avoid being stranded or washed up on the shore. A word of caution, this non-toxic confirmation is only for Elands Bay and does not preclude the red-tide to the North or South also including toxic forms of phytoplankton. This, and the possibility that some of the fish and shellfish may have been dead and rotting for longer than thought, makes it a wise choice to not feed any to family, friends, or pets.

The fish mortalities in False Bay are almost exclusively of the evil-eye pufferfish (blaasops) with counts of 300 to 400 dead fish per km of shore. There are no reports or data of any adverse water conditions or red-tide toxins that may have caused this.

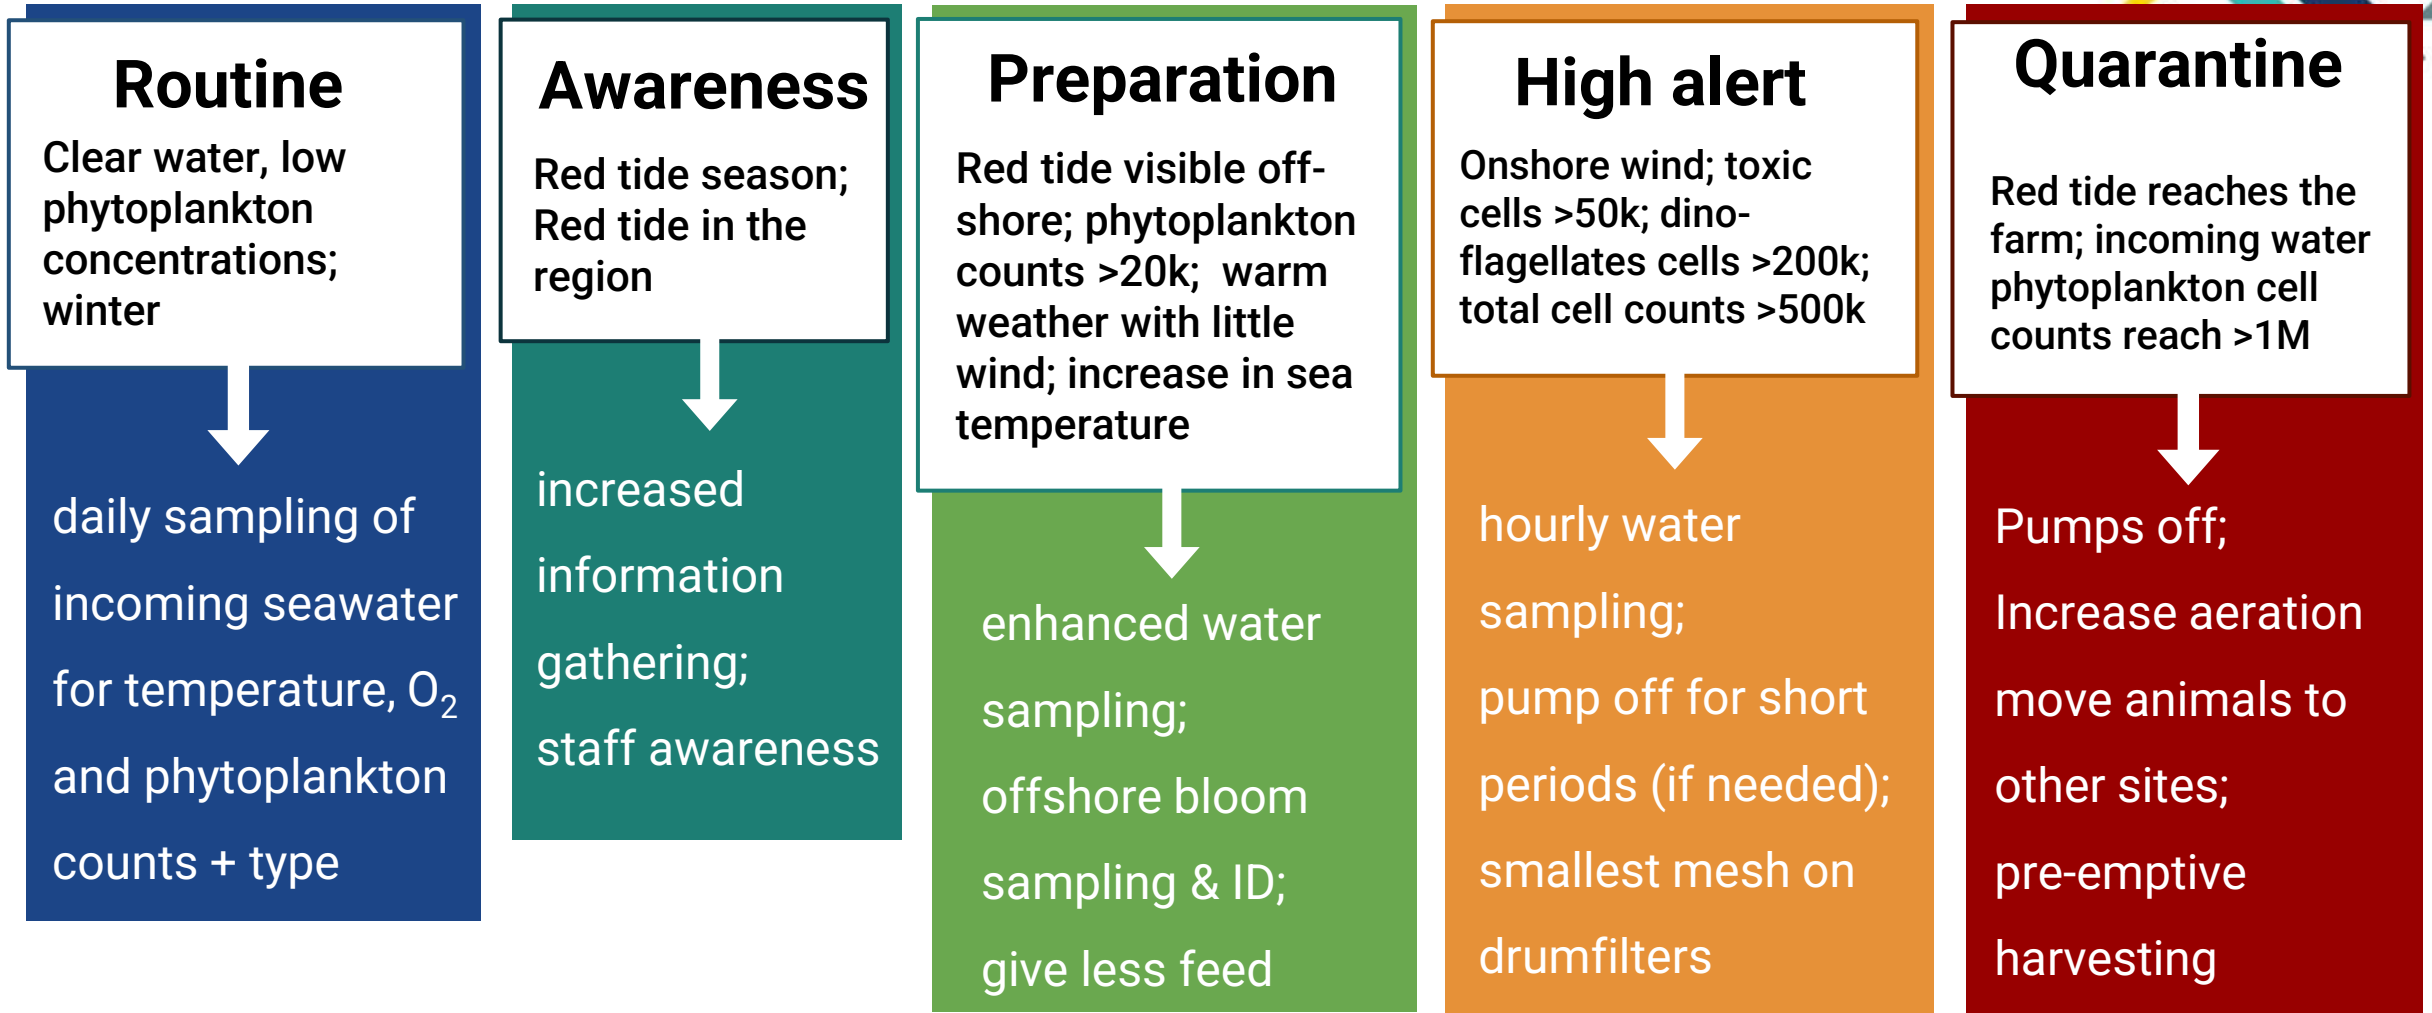

The Pufferfish carry the deadly neurotoxin (Tetrodotoxin) and should not be eaten. Beach dog walkers are strongly advised to keep their pets away from them. If one's dog does eat whole or part of a pufferfish, vomiting should be induced immediately, and a veterinary surgeon consulted.

Satellite composite map, red areas showing the highest phytoplankton densities and extent of the red tide on the West Coast.

Success stories and user testimonials

2017

- Walker Bay HAB caused a R70m loss across the abalone industry and major stock losses
- 14% loss of annual GDP contribution

2019

- OCIMS Aquaculture tool available
- A red tide persists for 3 months in Walker Bay
- *No losses to abalone farms*

“This is a super useful tool as it gave me a 2 month warning for the current bloom that has entered Saldanha Bay”
- industry user

“This is AMAZING!!!! ... I cannot overstate the importance of a tool such as this to our industry... it will make a big difference to our troubleshooting ability”
– aquaculture farm manager

Development plans for OCIMS phase 2

- Period 2022-2026
- Inclusion of exciting new products on the DeST
- GIS tool for farm-based phytoplankton counts
- Historical datasets made available via online data cubes for research purposes

Phytoplankton types maps

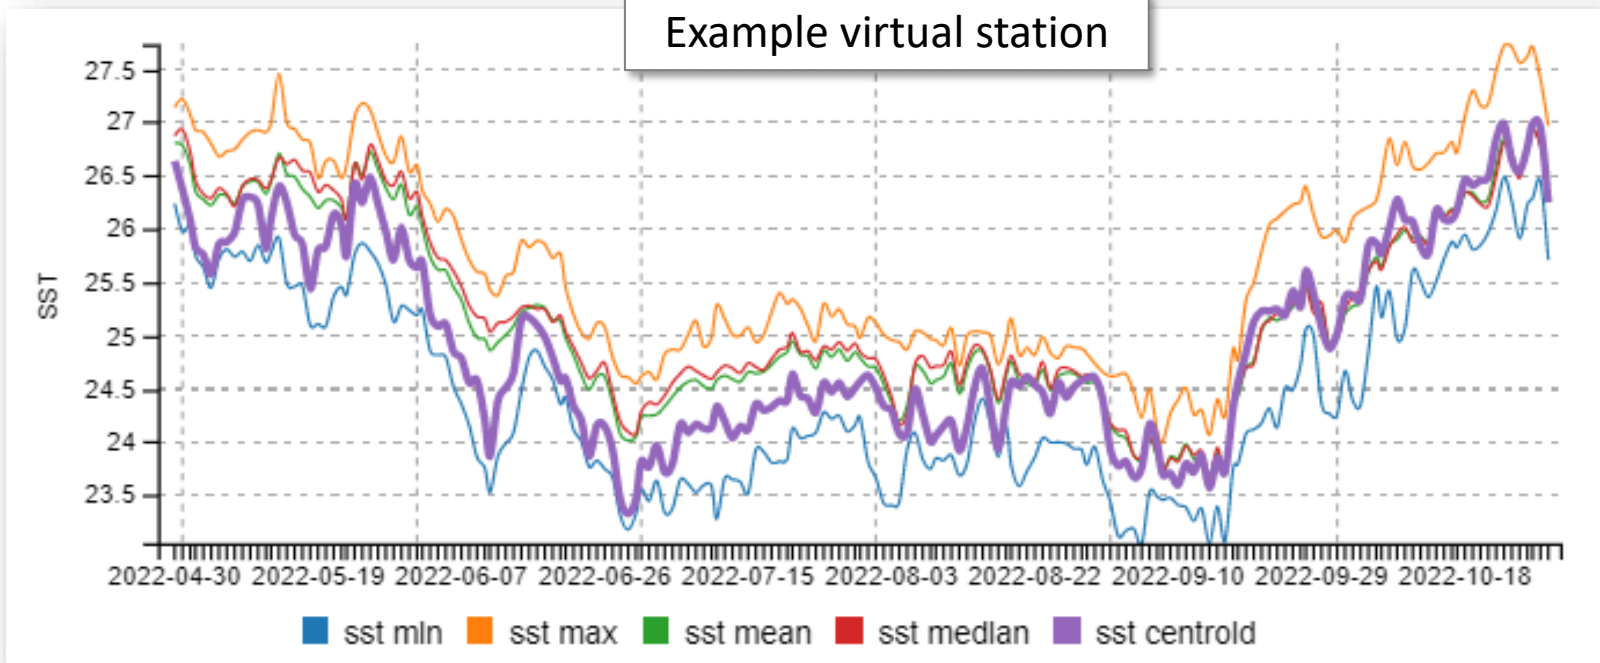

Anomaly maps
