our future through science

Objective

**Reduce the dose frequency of anti-tb drugs and simultaneously shorten duration of treatment by:
nanoencapsulation of drugs and adding a targeting ligand to
address persistent *M.tb* infection**

Background

Nanoparticles:

Refer to: Dr. H.S. Swai poster no. 83

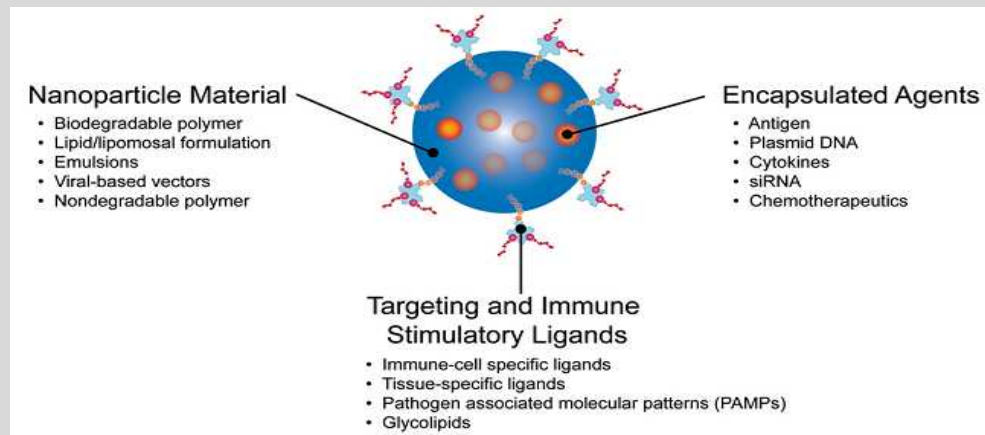

Mr. L. Kalambo presentation: Track 1 session 4 (03/06/10)

History:

- First drug delivery systems described 1960's – liposomes
- First controlled release polymer 1976
- Followed by other drug delivery & targeting ligands

Advantages

- Hydrophobic & hydrophilic drugs
- Targeted delivery in cells & tissue (small size)
- Controlled release
- Improvement of bioavailability

Background

Targeting ligand: Mycolic acids

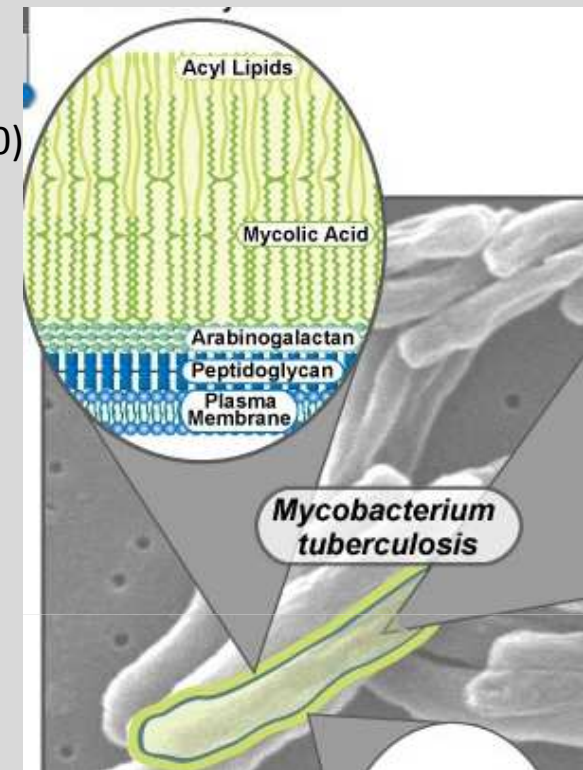

Refer to: Prof. J.A. Verschoor presentation: track1 session 2 (02/06/10)

The wax coat :

Mainly consists of mycolic acids (MA)

Properties of MA

- Convert macrophages into foam cells (Korf J.E. *et al.*, 2005)
- Assumes cholesterol nature and attracts cholesterol (Benadie Y. *et al.*, 2008).
- Present in high concentrations in the extracellular matrix of *M. tb.* biofilms , contributing to drug tolerance (Ojha A. *et al.*, 2008).

www.niaid.nih.gov/.../tuberculosis/tb1.jpg

Thus, MA may possibly target the cholesterol enriched infected areas

Methods and Results

The cholesteroloid nature of native MA

- Mycolic acids actually attract cholesterol !
- Thus, use MA as targeting agent in anti-TB NP drug delivery

SPR biosensor – measures mass accumulation on immobilized ligand

(Benadie Y. *et al.*, 2008)

Methods and Results

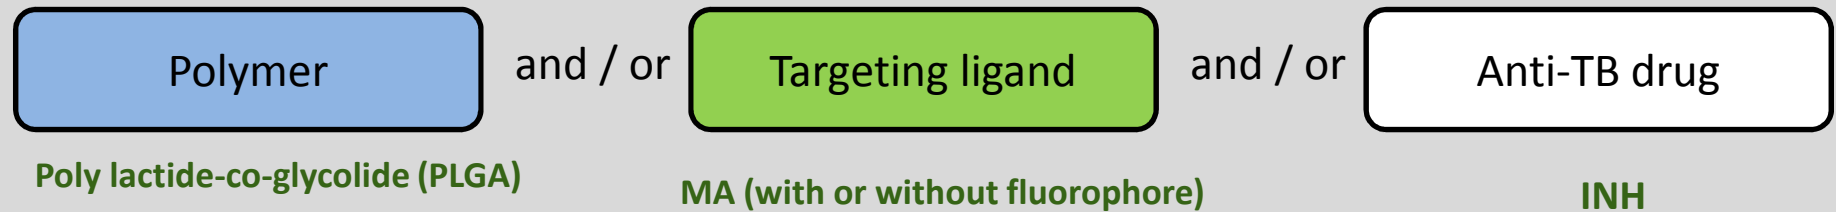

The cholesteroloid nature of native MA

- Struct relationship & attraction between free MA and cholesterol (Benadie Y. *et al.*, 2008).
- Principle confirmed using the ESPRIT biosensor
 - Cholesteroloid nature attenuated when MA structure altered

Methods and Results

Nano encapsulation of mycolic acids

Double emulsion evaporation technique (W/O/W).

~ 500nm

Methods and Results

Nanoparticle uptake in U937 and THP-1 macrophages

- Live cell images of fluorescently labeled MA PLGA NP uptake after 3 hours in macrophage cell lines.

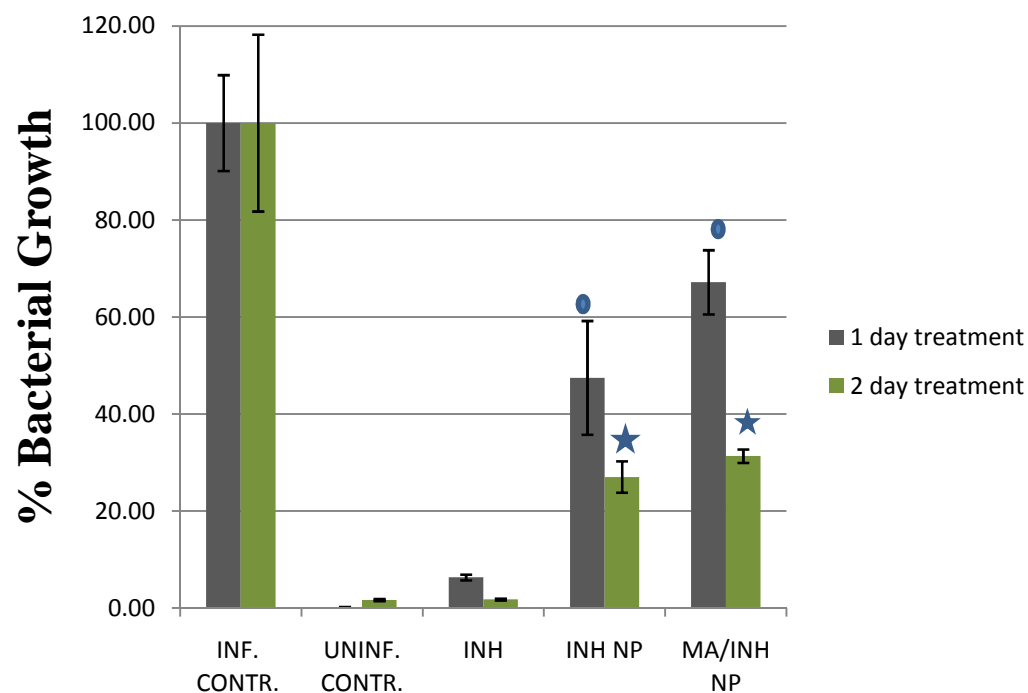

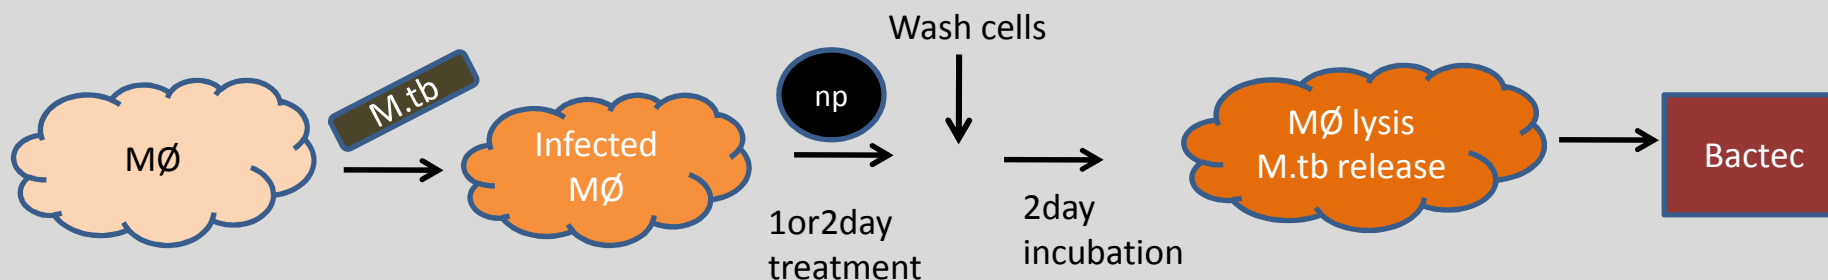

a) THP-1

b) U937 macrophages.

Methods and Results

Assess antibacterial effect of isoniazid (INH) containing nanoparticles vs free drug

Graph: [INH] = 0.2 ug/ml (2 ug/ml = out of range) ★ ● = P<0.01

1) Does NP release INH?
Yes, but slower

2) Does MA influence efficiency of Mtb inhib?
No clear indication at this point

Background

Targeting ligand: Aptamer against Mannose receptor

Refer to: Dr. B. Semete-Makokotlela email: Bsemete@csir.co.za

Aptamers:

- Ab like molecules made up from nucleic acids
- Directed against ligand
- Used as targeting molecule on surface of NP

www.ufz.de/data/11525.gif

Mannose receptor :

- Transmembrane receptor protein
- Over expressed in infected macrophages (acute stage only?)

Methods and Results

Synthesis of aptamers:

SELEX process:

Random RNA pool

Mannose receptor ligand

Partitioning with NanoSep 100kDa MWCO,
Selection of aptamers against target receptor using size exclusion

Challenges:

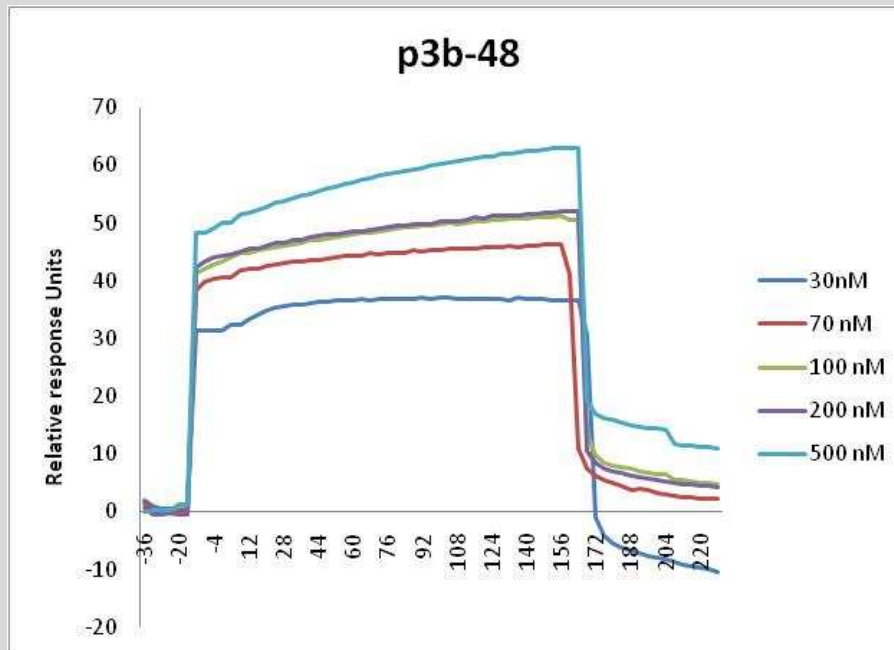

Could not enrich beyond 52% recovery
100 bp primer dimers

Methods and Results

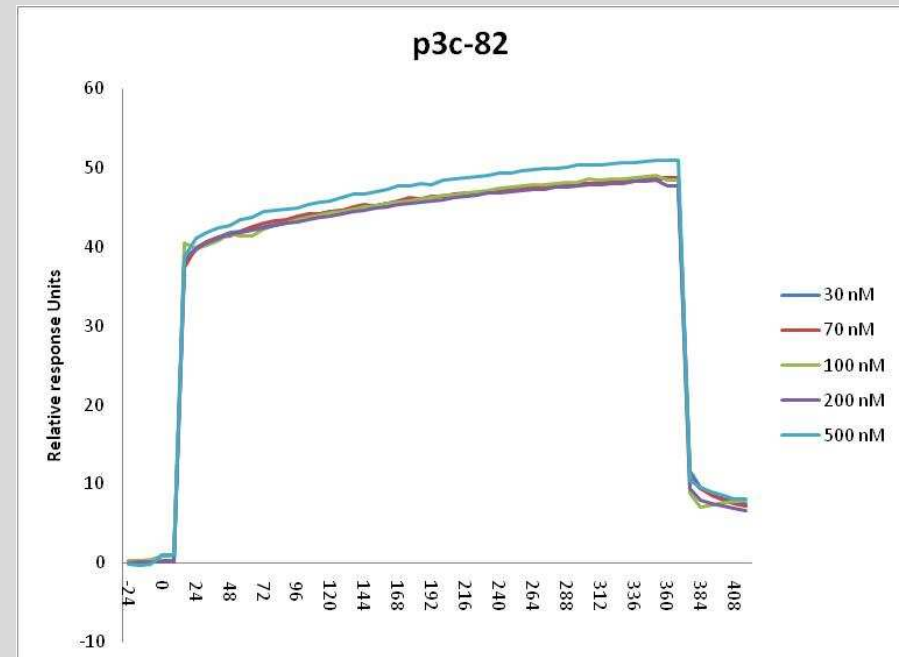

Testing for binding affinity on Biacore biosensor:

- Mannose receptor bound to surface on chip
- Test clones for binding affinity

Binding kinetics (10 clones)

KD: 1.3uM±2.5

KD: 60 nM±0.15

Methods and Results

Conjugate aptamers to nanoparticles:

 = PEG- COOH

 =Aptamer

- Succinamide coupling of PEG to NP
- Derivatise aptamer to form NH₂ – couple to NP

Conclusion and future perspective

- ✓ MA (chol) and Aptamers (against the mannose receptor) could be used as targeting tools

- ✓ MA:
 - ✓ Attract cholesterol
 - ✓ Successful production of MA NP ave size ~ 500nm
 - ✓ *In vitro* uptake into macrophages
 - ✓ *In vitro* localization possibly cytoplasm?
 - ✓ *In vitro* drug testing via BACTEC indicated:
 - ✓ INH released from NP
 - ✓ MA does not show advantage in early replication phase as expected

- ✓ Aptamers:
 - ✓ Against mannose receptor
 - ✓ Coupling to NP
 - ? *In vitro* drug testing via BACTEC
 - ? Confocal imaging of THP-1 cells
 - ? FACS to obtain quantitative data
